## Research interests

I am a computational cognitive neuroscientist interested in the conscious experience of inner speech and its neural underpinnings. My research combines experimental (e.g., psychophysics, EMG, M/EEG, TMS) and computational (e.g., mathematical modelling, machine learning) methods to understand how complex patterns of neural activity implement algorithms supporting the mental simulation of speech (inner speech) and other actions (motor imagery). In parallel, I also work on the development and dissemination of rigorous experimental and statistical methods.
